

CONFIDENTIAL — INTERNAL REFERENCE

Monty Mobile Meeting Brief

SMPP Integration — Telnet Failure Investigation & Resolution

MEETING DATE

July 15, 2026

OUR AWS IP (WHITELIST THIS)

176.34.210.141

MONTY SMPP GATEWAY

154.113.5.24 : 9013

CONNECTION STATUS

BLOCKED / TIMING OUT

CODE STATUS

100% READY

BLOCKER

MONTY FIREWALL

AWS EC2 Instance Details

OUTBOUND PUBLIC IP (WHITELIST THIS)

176.34.210.141

IP TYPE

Static / AWS Elastic IP

SSH USERNAME

ubuntu

AWS REGION

eu-west-1 (Ireland)

SSH KEY FILE

bztel-key.pem

INTERNET / OUTBOUND STATUS

Active & Verified

```
# SSH into the server
ssh -i .\bztel-key.pem ubuntu@176.34.210.141
```

Why We Need an AWS Instance

*"Our web app runs on Vercel, which is a serverless platform — it can't hold a permanent connection open. SMPP requires a persistent TCP socket that stays alive 24/7. So we have an AWS server that runs continuously, connects to your gateway, and keeps that connection alive. It also gives us a fixed IP address — **176.34.210.141** — which is the one we need you to whitelist."*

RESPONSIBILITY	VERCEL (WEB APP)	AWS EC2 (WORKER)
Serve web dashboard & API	✓ Yes	✗ No
Hold persistent TCP socket to Monty	✗ Cannot — times out	✓ Yes
Send SMPP heartbeats every 30s	✗ Would be killed	✓ Yes
Receive inbound DLR packets	✗ No open port	✓ Yes
Fixed outbound IP for whitelisting	✗ IPs rotate randomly	✓ 176.34.210.141

Telnet Test Process

1 SSH into the AWS server

```
ssh -i .\bztel-key.pem ubuntu@176.34.210.141
```

2 Run the telnet test

```
telnet 154.113.5.24 9013
```

3 Read the result:

```
✅ WORKING (whitelisted):  
Trying 154.113.5.24...  
Connected to 154.113.5.24.  ← Connection is open. GO LIVE.  
  
❌ STILL BLOCKED:  
Trying 154.113.5.24...  ← Just hangs. Firewall still blocking.
```

4 Exit telnet when done: Press Ctrl +] then type quit

Note: Telnet does NOT require SMPP credentials. It only checks if the TCP port is open. Credentials are only needed when starting the live worker.

What We Need from Monty Mobile

- 1 **Whitelist IP 176.34.210.141** on their firewall for TCP port 9013
- 2 **Provide real SMPP credentials** — the actual `system_id` and password for our account
- 3 **Confirm the `system_type`** — currently set to SMPP; confirm if this is correct or needs changing

Anticipated Questions & Answers

CONNECTION & IP

? What is your IP address that needs to be whitelisted?

176.34.210.141 — our AWS EC2 outbound public IP.

? How did you confirm that IP?

We ran `curl ipinfo.io/ip` directly from the EC2 server console.

? Is that IP static or dynamic?

Static. It's an AWS Elastic IP — it will not change.

? What port do you need access to?

Port **9013** on your gateway **154.113.5.24**.

? What protocol are you using?

SMPP over TCP — version 3.4.

? What bind type are you using?

Transceiver — so we can send SMS and receive delivery receipts on the same connection.

TECHNICAL SETUP

? What technology stack are you using?

A Node.js worker process on AWS EC2, using the `smpp` npm library.

? Are you using a dedicated server or shared hosting?

Dedicated AWS EC2 instance.

? What region is your server in?

AWS **eu-west-1** (Ireland).

? How are you handling reconnections?

The worker automatically reconnects every 5 seconds if the connection drops.

? How are you keeping the connection alive?

We send an `enquire_link` heartbeat every 30 seconds.

? What is your sending rate / throughput?

Up to 20 messages per second, with a 50ms delay between submissions.

SMS & DELIVERY RECEIPTS

? Are you expecting delivery receipts (DLRs)?

Yes. We set `registered_delivery: 1` on every `submit_sm`.

? How are you receiving DLRs?

Over the same SMPP transceiver connection via `deliver_sm` PDUs.

? What Sender ID format are you using?

Both alphanumeric and numeric. We auto-detect and set the correct TON/NPI values.

? Are you sending long messages?

Yes. Messages over 160 characters use `message_payload` instead of `short_message`.

? What system_type are you sending on bind?

SMPP — but we can change it to whatever you require.

 CREDENTIALS & ACCOUNT

? What System ID are you using?

We have placeholder credentials right now. We need you to provide the real `system_id` and password.

? Have you tested with our test environment first?

No — we weren't given test environment details. Do you have a staging SMPP endpoint we can use?

 TROUBLESHOOTING

? Have you confirmed it's definitely a firewall issue on our end?

Yes. Our server successfully reaches other external HTTPS services. Only your IP and port times out. A hanging connection with no response is consistent with a firewall drop, not a routing issue.

? Can you share logs of the failed connection?

The worker logs: *"Connecting to host 154.113.5.24:9013..."* — then the TCP socket never completes the handshake. No error is returned; it just times out.

? How long has this been blocked?

It has never connected. We built the integration and submitted the IP for whitelisting in early July 2026 and have been waiting since.

? Did you check your own firewall / AWS Security Group?

Yes. Our AWS Security Group allows all outbound traffic. The block is confirmed to be on your end.

Our Activation Steps (Once Whitelisted)

- 1 Verify with `telnet 154.113.5.24 9013` — confirm "Connected" message
- 2 Update `.env` on AWS with real `SMPP_SYSTEM_ID` and `SMPP_PASSWORD`, set `SMPP_ENABLED=true`
- 3 Start the worker: `pm2 start worker.js --name "bztel-smpp-worker"`
- 4 Monitor logs and verify successful SMPP bind and first message delivery
